

Operations software, handed over with the code.

We build the inspection, document, reporting and AI systems that audited operations run on, because our own facilities, consultancy and training work runs into the same problems.

WHAT IT DOES

Software for work that lives in spreadsheets and email today: inspections, documents, registers and dashboards. Every AI system we build has the same shape, written into the scope before anything is built. The agent reads, checks, chases and drafts. A named person approves anything that leaves the building.

SERVICES

01 Audit and inspection apps Inspections captured with photographs and timestamps, filed where an auditor can find them.	02 Document control systems One current version of each document, with its approval and its history, and the obsolete copies withdrawn.	03 Mobile apps for field work The paper job card rebuilt as one record before any screen is drawn.
04 AI agents and assistants Agents that match a buyer's index against what you hold, and assistants that answer from your own procedures.	05 Automation and dashboards An owner on every permit, calibration and medical, and the figures you already report in one view.	06 Portals, websites and integration Internal tools, Arabic and English websites from a content model you own, and systems that agree on one customer.

WHAT YOU RECEIVE

- Current-state process map**
Every step, handoff, wait and owner, from the one-week systems audit.
- Written specification**
What gets built, what stays manual, what it connects to and the acceptance tests.
- Data model document**
Every record, field, state and permission, written for the next developer.
- Test record and cutover record**
Each test traced to the specification, and the date the old process was retired.
- Handover pack and source code**
The operations manual and runbook, with the code in your repository from the first commit.

A TYPICAL ENGAGEMENT

A food plant eight weeks before a retailer audit

A food plant in Dammam 2nd Industrial City runs its daily prerequisite and hygiene rounds on paper, and a retailer audit is eight weeks away. We take the plant's own checklist, reorder it to the walking route and put a QR tag on each zone.

Missed checks show as missed. An out-of-limit answer forces a corrective action with an owner before the round can be submitted. The first checklist is live in the third week. Records start on the go-live date, and the specification says so plainly, so the older paper records are scanned and indexed alongside them.

By audit day the plant holds its app records, the scanned paper history and an evidence export the auditor can be handed as a folder.
